# Divide-and-Conquer

## Divide-and-conquer.

- Break up problem into several parts.
- Solve each part recursively.
- Combine solutions to sub-problems into overall solution.

## Most common usage.

- Break up problem of size  $n$  into **two** equal parts of size  $\frac{1}{2}n$ .
- Solve two parts recursively.
- Combine two solutions into overall solution in **linear time**.

## Consequence.

- Brute force:  $n^2$ .
- Divide-and-conquer:  $n \log n$ .

Divide et impera.  
Veni, vidi, vici.  
- *Julius Caesar*

# 5.1 Mergesort

---

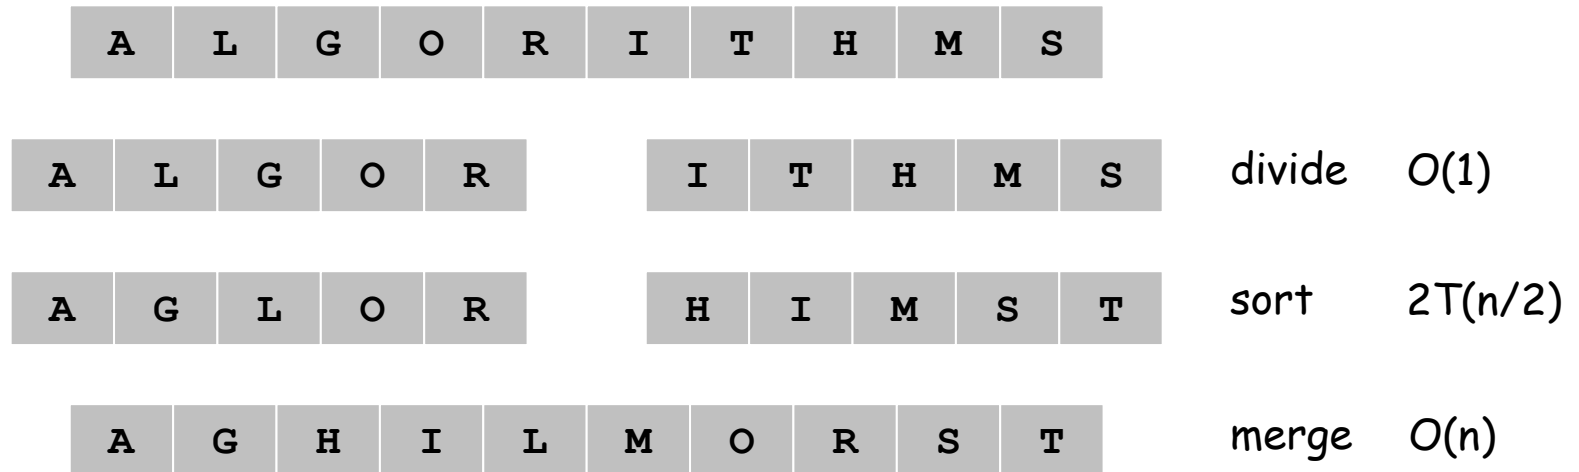

# Mergesort

## Mergesort.

- Divide array into two halves.
- Recursively sort each half.
- Merge two halves to make sorted whole.

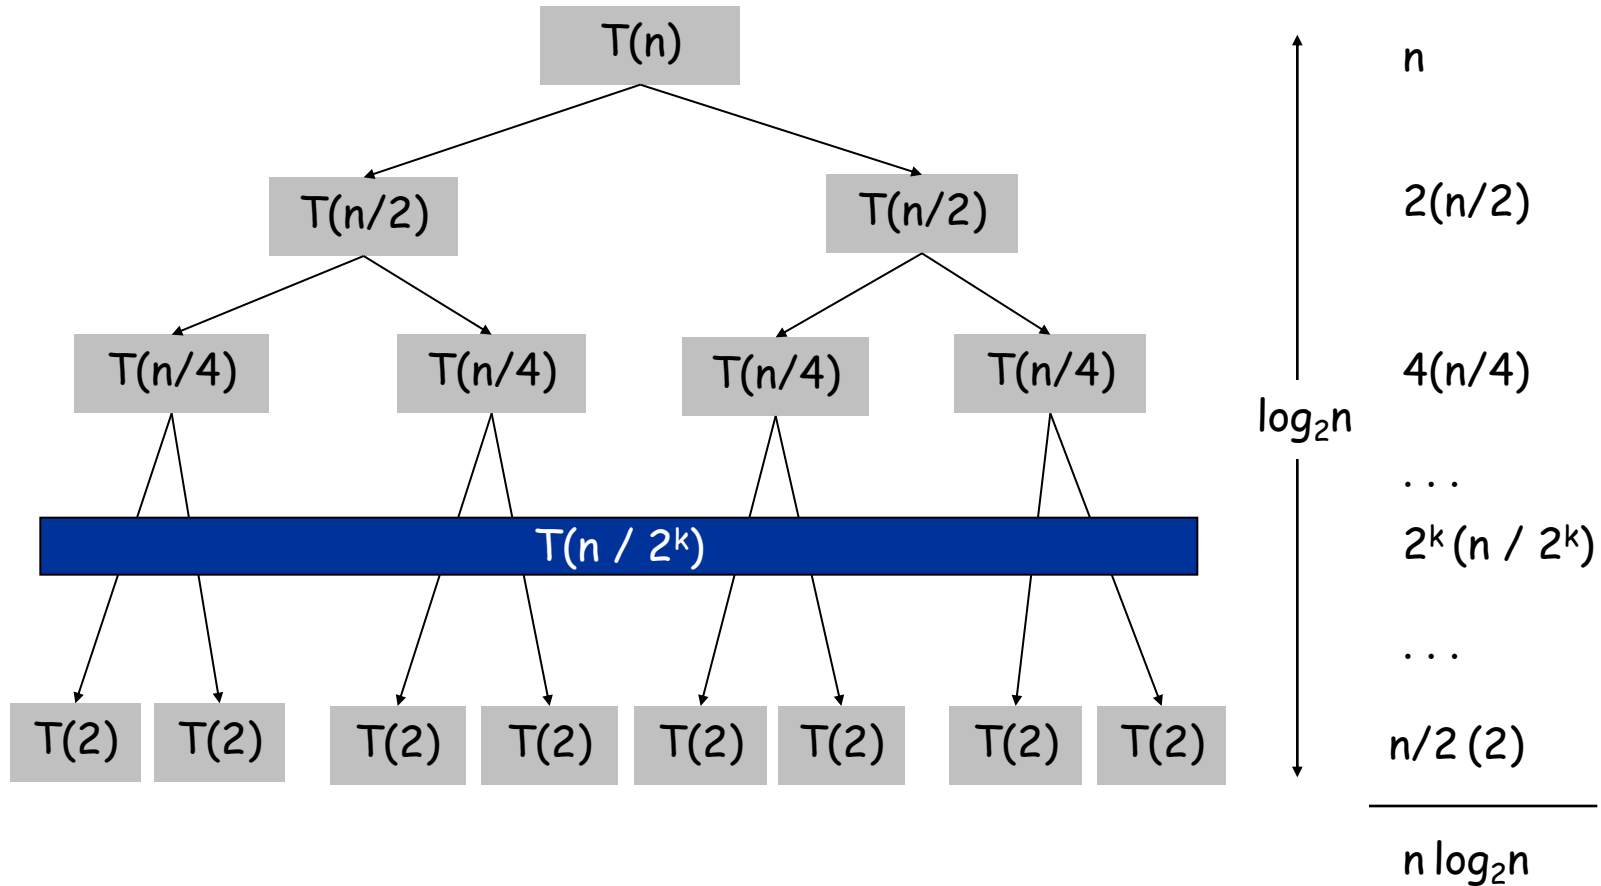

Jon von Neumann (1945)

# Proof by Recursion Tree

$$T(n) = \begin{cases} 0 & \text{if } n=1 \\ \underbrace{2T(n/2)}_{\text{sorting both halves}} + \underbrace{n}_{\text{merging}} & \text{otherwise} \end{cases}$$

## 5.3 Counting Inversions

---

# Counting Inversions

Music site tries to match your song preferences with others.

- You rank  $n$  songs.
- Music site consults database to find people with **similar** tastes.

**Similarity metric:** number of inversions between two rankings.

- My rank:  $1, 2, \dots, n$ .
- Your rank:  $a_1, a_2, \dots, a_n$ .
- Songs  $i$  and  $j$  **inverted** if  $i < j$ , but  $a_i > a_j$ .

**Want:** Count number of inversions

	Songs				
	A	B	C	D	E
Me	1	2	3	4	5
You	1	3	4	2	5

Inversions  
3-2, 4-2

**Brute force:** check all  $\Theta(n^2)$  pairs  $i$  and  $j$ .

# Applications

## Applications.

- Voting theory.
- Collaborative filtering.
- Measuring the "sortedness" of an array.
- Sensitivity analysis of Google's ranking function.
- Rank aggregation for meta-searching on the Web.
- Nonparametric statistics (e.g., Kendall's Tau distance).

# Counting Inversions: Divide-and-Conquer

Divide-and-conquer.

1	5	4	8	10	2	6	9	12	11	3	7
---	---	---	---	----	---	---	---	----	----	---	---

# Counting Inversions: Divide-and-Conquer

Divide-and-conquer.

- **Divide:** separate list into two pieces.

1	5	4	8	10	2	6	9	12	11	3	7
---	---	---	---	----	---	---	---	----	----	---	---

Divide:  $O(1)$ .

1	5	4	8	10	2	6	9	12	11	3	7
---	---	---	---	----	---	---	---	----	----	---	---

# Counting Inversions: Divide-and-Conquer

## Divide-and-conquer.

- **Divide:** separate list into two pieces.
- **Conquer:** recursively count inversions in each half.

Divide:  $O(1)$ .

Conquer:  $2T(n / 2)$

5 blue-blue inversions

8 green-green inversions

5-4, 5-2, 4-2, 8-2, 10-2

6-3, 9-3, 9-7, 12-3, 12-7, 12-11, 11-3, 11-7

# Counting Inversions: Divide-and-Conquer

## Divide-and-conquer.

- **Divide:** separate list into two pieces.
- **Conquer:** recursively count inversions in each half.
- **Combine:** count inversions where  $a_i$  and  $a_j$  are in different halves, and return sum of three quantities.

Divide:  $O(1)$ .

5 blue-blue inversions

8 green-green inversions

Conquer:  $2T(n / 2)$

9 blue-green inversions

5-3, 4-3, 8-6, 8-3, 8-7, 10-6, 10-9, 10-3, 10-7

Combine: ???

Total =  $5 + 8 + 9 = 22$ .

# Counting Inversions: Combine

Combine: count blue-green inversions

Q: What happens if each half is **sorted**?

A: Can count blue-green inversions in  $O(n)$

13 blue-green inversions:  $6 + 3 + 2 + 2 + 0 + 0$

# Counting Inversions: Implementation

```
Count_Inversions(L) {  
    if list L has one element  
        return 0 and the list L  
  
    Divide the list into two halves A and B  
    (rA) ← Count_Inversions(A)  
    (A) ← Sort(A)  
    (rB) ← Count_Inversions(B)  
    (B) ← Sort(B)  
    r ← Count_Inversions_Between(A, B)  
  
    return rA + rB + r  
}
```

$$T(n) \leq T(\lfloor n/2 \rfloor) + T(\lceil n/2 \rceil) + O(n \log n) \Rightarrow T(n) =$$

# Counting Inversions: Implementation

```
Count_Inversions(L) {  
    if list L has one element  
        return 0 and the list L  
  
    Divide the list into two halves A and B  
    (rA) ← Count_Inversions(A)  
    (A) ← Sort(A)  
    (rB) ← Count_Inversions(B)  
    (B) ← Sort(B)  
    r ← Count_Inversions_Between(A, B)  
  
    return rA + rB + r  
}
```

$$T(n) \leq T(\lfloor n/2 \rfloor) + T(\lceil n/2 \rceil) + O(n \log n) \Rightarrow T(n) = O(n \log^2 n)$$

## Counting Inversions: Combine Revised

We want faster,  $O(n \log n)$ ... Cannot spend  $O(n \log n)$  to sort in each recursion of `Count_Inversions`

Idea: Make `Count_Inversions` return sorted list

```
Count_Inversions(L) {  
  if list L has one element  
    return 0 and the list L  
  
  Divide the list into two halves A and B  
  ( $r_A$ )  $\leftarrow$  Count_Inversions(A)  
  (A)  $\leftarrow$  Sort(A)  
  ( $r_B$ )  $\leftarrow$  Count_Inversions(B)  
  (B)  $\leftarrow$  Sort(B)  
  r  $\leftarrow$  Count_Inversions_Between(A, B)  
  
  return  $r_A + r_B + r$   
}
```

Need to combine A, B  
into sorted list

# Counting Inversions: Implementation

Post-condition. [Sort-and-Count] L is sorted.

```
Sort-and-Count(L) {  
  if list L has one element  
    return 0 and the list L  
  
  Divide the list into two halves A and B  
  (rA, A) ← Sort-and-Count(A)  
  (rB, B) ← Sort-and-Count(B)  
  r ← Count_Inversions_Between(A, B)  
  L ← Merge(A,B)  
  
  return r = rA + rB + r and the sorted list L  
}
```

$$T(n) \leq T(\lfloor n/2 \rfloor) + T(\lceil n/2 \rceil) + O(n) \Rightarrow T(n) = O(n \log n)$$

## 5.4 Closest Pair of Points

---

# Closest Pair of Points

**Closest pair.** Given  $n$  points in the plane, find a pair with smallest Euclidean distance between them.

**Fundamental geometric primitive.**

- Games, graphics, computer vision, geographic information systems, molecular modeling, **air traffic control**.

**Brute force.** Check all pairs of points  $p$  and  $q$  with  $\Theta(n^2)$  comparisons.

**1-D version.**  $O(n \log n)$  easy if points are on a line.

**Assumption to simplify presentation:** No two points have same  $x$  coordinate.

# Closest Pair of Points

Algorithm.

- **Divide:** draw vertical line  $L$  so that roughly  $\frac{1}{2}n$  points on each side.

# Closest Pair of Points

## Algorithm.

- Divide: draw vertical line  $L$  so that roughly  $\frac{1}{2}n$  points on each side.
- **Conquer**: find closest pair in each side recursively.

# Closest Pair of Points

## Algorithm.

- Divide: draw vertical line  $L$  so that roughly  $\frac{1}{2}n$  points on each side.
- Conquer: find closest pair in each side recursively.
- **Combine**: find closest pair with one point in each side. ← seems like  $\Theta(n^2)$
- Return best of 3 solutions.

# Closest Pair of Points

Let  $\delta$  be the smallest closest distance found so far

**Idea 1:** Only need to consider pairs with one point in each side at distance less than  $\delta$ .

# Closest Pair of Points

Let  $\delta$  be the smallest closest distance found so far

**Idea 1:** Only need to consider pairs with one point in each side at distance less than  $\delta$ .

So only need to consider points within  $\delta$  of line  $L$

# Closest Pair of Points

Find closest pair with one point in each side:

- Sort points in  $2\delta$ -strip by their y coordinate.

# Closest Pair of Points

Find closest pair with one point in each side:

- Sort points in  $2\delta$ -strip by their y coordinate.
- Only check distances of those within **12 positions** in sorted list!  
[So only need to compute distance between 1 and 2, 3, ..., 12  
2 and 3, 4, ..., 13 ....]

# Closest Pair of Points

Find closest pair with one point in each side:

- Sort points in  $2\delta$ -strip by their y coordinate.
- Only check distances of those within **12 positions** in sorted list!

**Q:** Why is this enough? Can the following happen?

**A:** No! Points on each side are at distance at least  $\delta$  from each other

# Closest Pair of Points

**Def.** Let  $s_i$  be the point in the  $2\delta$ -strip, with the  $i^{\text{th}}$  smallest  $y$ -coordinate.

**Claim.** If  $|i - j| > 12$ , then the distance between  $s_i$  and  $s_j$  is at least  $\delta$ .

**Proof.**

- Partition the strip into  $\frac{1}{2}\delta$ -by- $\frac{1}{2}\delta$  boxes
- No two points lie in same  $\frac{1}{2}\delta$ -by- $\frac{1}{2}\delta$  box.
- Two points at least 2 rows apart have distance  $\geq 2(\frac{1}{2}\delta)$ .
- Only need to compare points within 3 rows

# Closest Pair Algorithm

**Sort** all points according to x-coordinate.

$O(n \log n)$

`Closest-Pair( $p_1, \dots, p_n$ ) {`

`$\delta_1$  = Closest-Pair(left half)`

`$\delta_2$  = Closest-Pair(right half)`

`$\delta$  = min( $\delta_1, \delta_2$ )`

$2T(n/2)$

**Delete** all points further than  $\delta$  from separation line  $L$

$O(n)$

**Sort** remaining points by y-coordinate.

$O(n \log n)$

**Scan** points in y-order and compare distance between each point and next 12 neighbors. If any of these distances is less than  $\delta$ , update  $\delta$ .

$O(n)$

`return  $\delta$ .`

`}`

# Closest Pair of Points: Analysis

Running time.

$$T(n) \leq 2T(n/2) + O(n \log n) \Rightarrow T(n) = O(n \log^2 n)$$

Q. Can we achieve  $O(n \log n)$ ?

A. Yes. Like counting inversions, don't sort points in strip from scratch each time.

- Each recursive call returns the lists of all points sorted by y coordinate
- Sort by **merging** two pre-sorted lists.

$$T(n) \leq 2T(n/2) + O(n) \Rightarrow T(n) = O(n \log n)$$

# Closest Pair Algorithm: $O(n \log n)$

[Shamos, Hoey '75]

Sort all points according to x-coordinate.

$O(n \log n)$

```
SortbyY_and_Closest-Pair( $p_1, \dots, p_n$ ) {
```

```
    ( $A, \delta_1$ ) = SortbyY_and_Closest-Pair(left half)
```

```
    ( $B, \delta_2$ ) = SortbyY_and_Closest-Pair(right half)
```

```
     $\delta = \min(\delta_1, \delta_2)$ 
```

$2T(n/2)$

```
     $S \leftarrow$  Merge( $A, B$ ) by y-coordinate.
```

$O(n)$

Let  $S'$  be the list obtained from  $S$  by deleting all points further than  $\delta$  from separation line  $L$

$O(n)$

Scan points of  $S'$  in y-order and compare distance between each point and next 7 neighbors. If any of these distances is less than  $\delta$ , update  $\delta$ .

$O(n)$

```
    return  $\delta$  and  $S$ .
```

```
}
```

# Closest Pair of Points

## Fastest algorithms

- $O(n \log \log n)$  [Fortune, Hopcroft '79]
- Expected time  $O(n)$  [Khuller, Matias '95]

## 5.5 Integer Multiplication

---

# Divide-and-Conquer Multiplication: Warmup

To multiply two  $n$ -digit integers:

- Multiply four  $\frac{1}{2}n$ -digit integers.
- Add two  $\frac{1}{2}n$ -digit integers, and shift to obtain result.

$$\begin{aligned}x &= 2^{n/2} \cdot x_1 + x_0 \\y &= 2^{n/2} \cdot y_1 + y_0 \\xy &= (2^{n/2} \cdot x_1 + x_0)(2^{n/2} \cdot y_1 + y_0) = 2^n \cdot x_1 y_1 + 2^{n/2} \cdot (x_1 y_0 + x_0 y_1) + x_0 y_0\end{aligned}$$

$$T(n) = \underbrace{4T(n/2)}_{\text{recursive calls}} + \underbrace{\Theta(n)}_{\text{add, shift}} \Rightarrow T(n) = \Theta(n^2)$$

assumes  $n$  is a power of 2

# Karatsuba Multiplication

To multiply two  $n$ -digit integers:

- Add two  $\frac{1}{2}n$  digit integers.
- Multiply **three**  $\frac{1}{2}n$ -digit integers.
- Add, subtract, and shift  $\frac{1}{2}n$ -digit integers to obtain result.

$$\begin{aligned}x &= 2^{n/2} \cdot x_1 + x_0 \\y &= 2^{n/2} \cdot y_1 + y_0 \\xy &= 2^n \cdot x_1 y_1 + 2^{n/2} \cdot (x_1 y_0 + x_0 y_1) + x_0 y_0 \\&= 2^n \cdot x_1 y_1 + 2^{n/2} \cdot ((x_1 + x_0)(y_1 + y_0) - x_1 y_1 - x_0 y_0) + x_0 y_0\end{aligned}$$

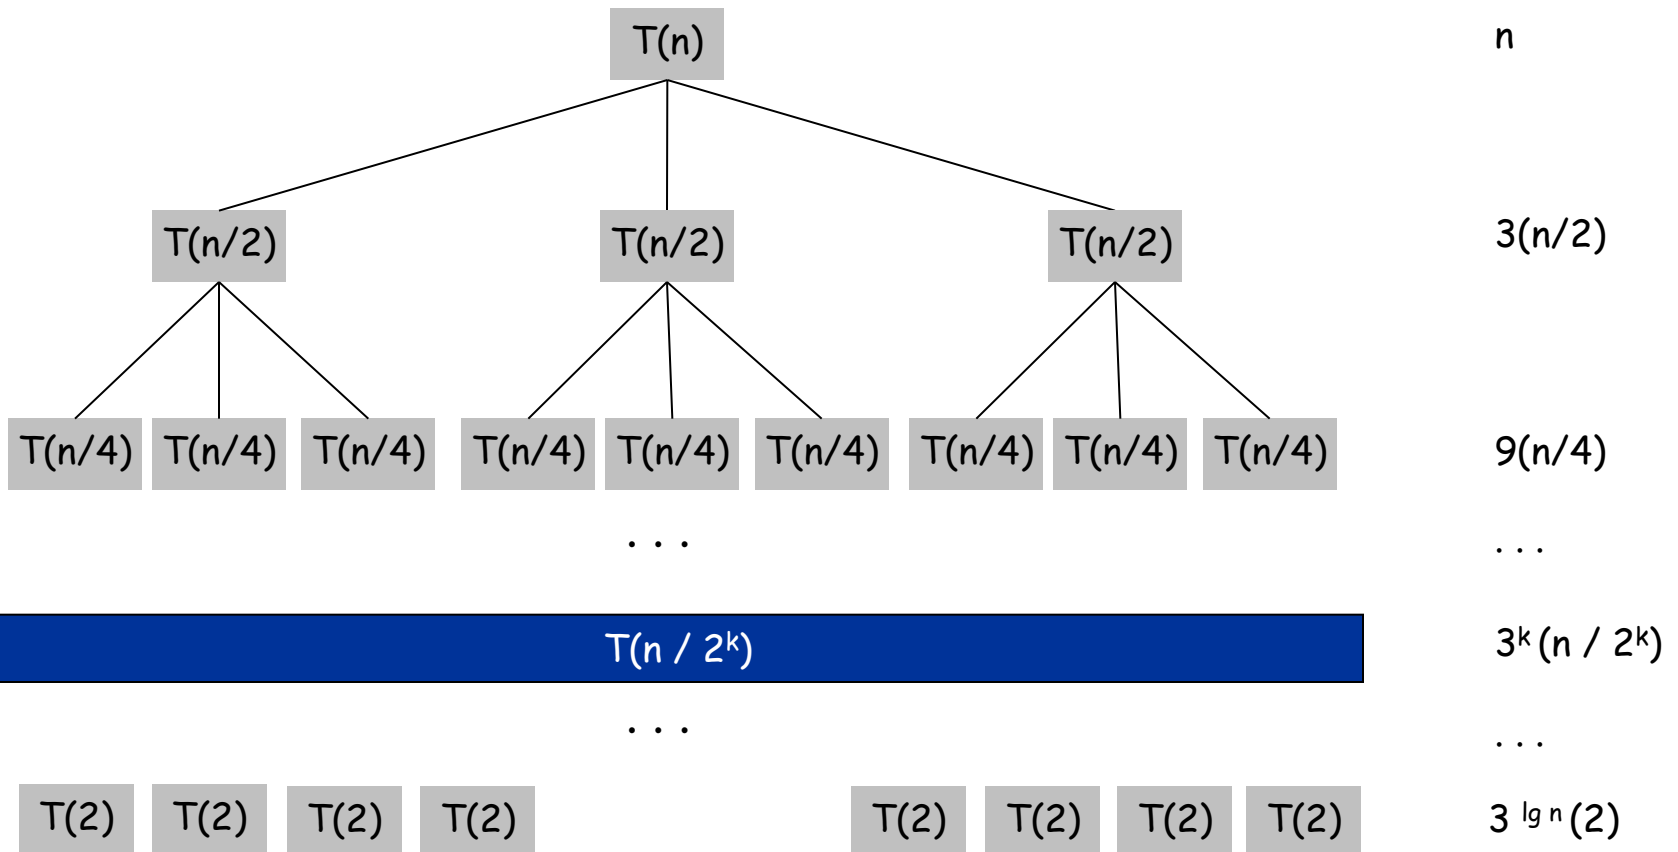

$A$  $B$  $A$  $C$  $C$

**Theorem.** [Karatsuba-Ofman, 1962] Can multiply two  $n$ -digit integers in  $O(n^{1.585})$  bit operations.

# Karatsuba: Recursion Tree

$$T(n) = \begin{cases} 0 & \text{if } n=1 \\ 3T(n/2) + n & \text{otherwise} \end{cases}$$

$$T(n) = \sum_{k=0}^{\log_2 n} n \left(\frac{3}{2}\right)^k = \frac{\left(\frac{3}{2}\right)^{1+\log_2 n} - 1}{\frac{3}{2} - 1} = 3n^{\log_2 3} - 2$$

# Matrix Multiplication

---

# Matrix Multiplication

Matrix multiplication. Given two  $n$ -by- $n$  matrices  $A$  and  $B$ , compute  $C = AB$ .

$$c_{ij} = \sum_{k=1}^n a_{ik} b_{kj}$$

$$\begin{bmatrix} c_{11} & c_{12} & \cdots & c_{1n} \\ c_{21} & c_{22} & \cdots & c_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ c_{n1} & c_{n2} & \cdots & c_{nn} \end{bmatrix} = \begin{bmatrix} a_{11} & a_{12} & \cdots & a_{1n} \\ a_{21} & a_{22} & \cdots & a_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ a_{n1} & a_{n2} & \cdots & a_{nn} \end{bmatrix} \times \begin{bmatrix} b_{11} & b_{12} & \cdots & b_{1n} \\ b_{21} & b_{22} & \cdots & b_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ b_{n1} & b_{n2} & \cdots & b_{nn} \end{bmatrix}$$

Brute force.  $\Theta(n^3)$  arithmetic operations.

Fundamental question. Can we improve upon brute force?

# Matrix Multiplication: Warmup

## Divide-and-conquer.

- Divide: partition  $A$  and  $B$  into  $\frac{1}{2}n$ -by- $\frac{1}{2}n$  blocks.
- Conquer: multiply 8  $\frac{1}{2}n$ -by- $\frac{1}{2}n$  recursively.
- Combine: add appropriate products using 4 matrix additions.

$$\begin{bmatrix} C_{11} & C_{12} \\ C_{21} & C_{22} \end{bmatrix} = \begin{bmatrix} A_{11} & A_{12} \\ A_{21} & A_{22} \end{bmatrix} \times \begin{bmatrix} B_{11} & B_{12} \\ B_{21} & B_{22} \end{bmatrix}$$

$$\begin{aligned} C_{11} &= (A_{11} \times B_{11}) + (A_{12} \times B_{21}) \\ C_{12} &= (A_{11} \times B_{12}) + (A_{12} \times B_{22}) \\ C_{21} &= (A_{21} \times B_{11}) + (A_{22} \times B_{21}) \\ C_{22} &= (A_{21} \times B_{12}) + (A_{22} \times B_{22}) \end{aligned}$$

$$T(n) = \underbrace{8T(n/2)}_{\text{recursive calls}} + \underbrace{\Theta(n^2)}_{\text{add, form submatrices}} \Rightarrow T(n) = \Theta(n^3)$$

# Matrix Multiplication: Key Idea

Key idea. multiply 2-by-2 block matrices with only **7** multiplications.

$$\begin{bmatrix} C_{11} & C_{12} \\ C_{21} & C_{22} \end{bmatrix} = \begin{bmatrix} A_{11} & A_{12} \\ A_{21} & A_{22} \end{bmatrix} \times \begin{bmatrix} B_{11} & B_{12} \\ B_{21} & B_{22} \end{bmatrix}$$

$$C_{11} = P_5 + P_4 - P_2 + P_6$$

$$C_{12} = P_1 + P_2$$

$$C_{21} = P_3 + P_4$$

$$C_{22} = P_5 + P_1 - P_3 - P_7$$

$$P_1 = A_{11} \times (B_{12} - B_{22})$$

$$P_2 = (A_{11} + A_{12}) \times B_{22}$$

$$P_3 = (A_{21} + A_{22}) \times B_{11}$$

$$P_4 = A_{22} \times (B_{21} - B_{11})$$

$$P_5 = (A_{11} + A_{22}) \times (B_{11} + B_{22})$$

$$P_6 = (A_{12} - A_{22}) \times (B_{21} + B_{22})$$

$$P_7 = (A_{11} - A_{21}) \times (B_{11} + B_{12})$$

- 7 multiplications.
- $18 = 10 + 8$  additions (or subtractions).

# Fast Matrix Multiplication

Fast matrix multiplication. (Strassen, 1969)

- Divide: partition  $A$  and  $B$  into  $\frac{1}{2}n$ -by- $\frac{1}{2}n$  blocks.
- Compute: 14  $\frac{1}{2}n$ -by- $\frac{1}{2}n$  matrices via 10 matrix additions.
- Conquer: multiply 7  $\frac{1}{2}n$ -by- $\frac{1}{2}n$  matrices recursively.
- Combine: 7 products into 4 terms using 8 matrix additions.

Analysis.

- Assume  $n$  is a power of 2.
- $T(n) = \#$  arithmetic operations.

$$T(n) = \underbrace{7T(n/2)}_{\text{recursive calls}} + \underbrace{\Theta(n^2)}_{\text{add, subtract}} \Rightarrow T(n) = \Theta(n^{\log_2 7}) = O(n^{2.81})$$

# Fast Matrix Multiplication in Practice

## Implementation issues.

- Sparsity.
- Caching effects.
- Numerical stability.
- Odd matrix dimensions.

## Common misperception: "Strassen is only a theoretical curiosity."

- Advanced Computation Group at Apple Computer reports 8x speedup on G4 Velocity Engine when  $n \sim 2,500$ .
- Range of instances where it's useful is a subject of controversy.

**Remark.** Can "Strassenize"  $Ax=b$ , determinant, eigenvalues, and other matrix ops.

# Fast Matrix Multiplication in Theory

Q. Multiply two 2-by-2 matrices with only 7 scalar multiplications?

A. Yes! [Strassen, 1969]  $\Theta(n^{\log_2 7}) = O(n^{2.81})$

Q. Multiply two 2-by-2 matrices with only 6 scalar multiplications?

A. Impossible. [Hopcroft and Kerr, 1971]  $\Theta(n^{\log_2 6}) = O(n^{2.59})$

Q. Two 3-by-3 matrices with only 21 scalar multiplications?

A. Also impossible.  $\Theta(n^{\log_3 21}) = O(n^{2.77})$

Q. Two 70-by-70 matrices with only 143,640 scalar multiplications?

A. Yes! [Pan, 1980]  $\Theta(n^{\log_{70} 143640}) = O(n^{2.80})$

## Decimal wars.

- December, 1979:  $O(n^{2.521813})$ .
- January, 1980:  $O(n^{2.521801})$ .

# Fast Matrix Multiplication in Theory

Best known.  ~~$O(n^{2.376})$~~  [Coppersmith-Winograd, 1987.]

$O(n^{2.3728639})$  [Williams '13, Le Gall '14]

Conjecture.  $O(n^{2+\varepsilon})$  for any  $\varepsilon > 0$ .

Caveat. Theoretical improvements to Strassen are progressively less practical.
